

# Primers

A primer is designed to provide adhesion and corrosion protection for bare metals. If you have a car sandblasted, chemically dipped, or if you sand all the paint off. You ideally you want to apply a coat or two of primer to protect it while you continue to work on the car.

## Self-Etching primers DX1791

These have a small amount acid in them to etch into the metal and inhibit any microscopic rust. They will leave behind an acrylic like coating that will be moisture-proof. They must be top coated for durability. For the best durability, use an epoxy primer over the top. Check with product bulletin(P-sheet) for it must be used with it's activator.

## Epoxy primers DP-LF

These provide the best in long term durability and adhesion. This is the best primer if you are going to work on a long term project and work on it in pieces. Because of the great adhesion and protection properties, epoxy primers should be used on the bare metal or over the top of self-etching primers. You may then do your filler and glaze work on top of the epoxy primer. This will protect the underside of your filler work from moisture. Epoxy primers are the only primers that you can do this with. It can also be used as a sealer. This will keep you from having to buy a separate sealer. Check with product bulletin(P-sheet) to use with either DP401LF or DP402LF catalyst.

## OMNI Epoxy

These are PPG's value based epoxies. They are a good product, but sometimes require an additional coat to achieve full protection and coverage. However, they are a cheaper price.
